Problem Statement

STUDENTS TODAY:

- First time managing money
- Unstable income
- No financial knowledge

BUT:

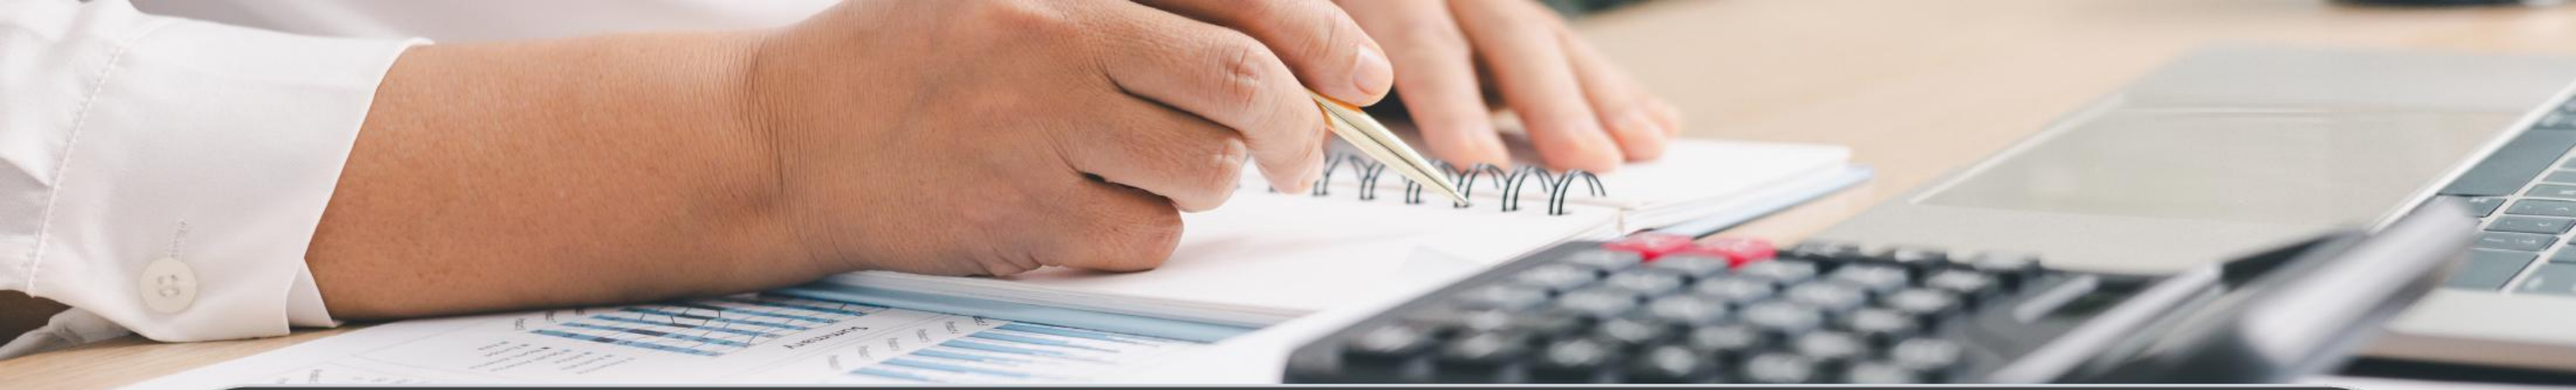
- No financial advisor
- No real-time guidance

SO THEY ASK:

- “Can I afford this?”
- “Am I overspending?”
- “Is my income enough?”

Students don’t need more data. They need direction.

Tracking the past is not enough.
Students need to understand the consequences of their decisions.



Solution:

AI CFO = Runway + What-If Decision Engine

What it does:

1. Understands you → profile, income, lifestyle
2. Calculates your financial runway → how long you can survive
3. Simulates decisions in real time → “Can I afford this?”

How It Works (AI System Architecture)

- Memory Layer → mem9 (user profile & preferences)
- Data Layer → TiDB (cashflow, scenarios, cached data)
- Intelligence Layer → Agnes Claw (LLM)
- External Data → Bright Data (web scraping)
- Visualization → Chart Renderer
- Deployment → Zeabur (live server)

Demo

Our AI CFO:

Not tracking → decision-making
Not passive → proactive
Not generic → student-focused

Thank You!
